Four waves made today's agents possible

Rules

People write logic for stable, bounded problems.

Neural networks

Machines learn useful patterns from examples.

Large models

Broad training creates reusable language and pattern engines.

Agents

A harness adds memory, tools, a loop, and guardrails.

Reference milestones: Dartmouth workshop, 1956; deep-learning breakthrough, 2012; Transformer, 2017; public chat assistants, 2022.

Superintelligence is not a synonym for AI

Narrow AI (ANI)

Exists today. Excellent at specific, bounded tasks — drafting, prediction, inspection, translation. Every tool in this course is narrow AI.

General AI (AGI)

Theoretical. Human-level ability across many unrelated tasks — able to learn anything a person can. It does not exist yet.

Superintelligence (SI)

Theoretical. An intellect beyond the best human minds in nearly every field. It does not exist — and it is not a marketing word for today's products.

When a pitch says "superintelligence," ask which rung. Everything you will use this year is rung one.

A neural network learns by adjusting many tiny connections

Inputs

Pixels

Sensor readings

Words

Outputs

Defect probability

Failure risk

Next token

Training

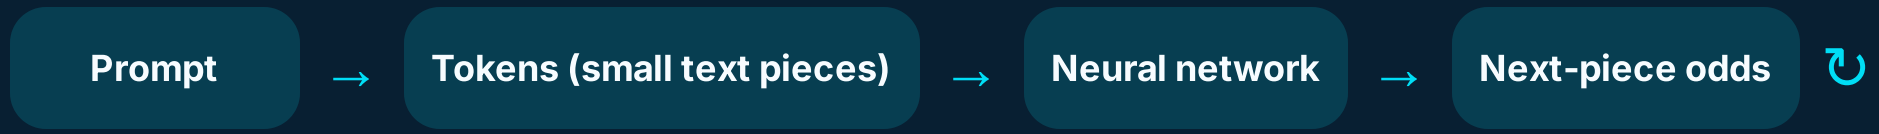

Show examples, measure the error, and adjust numerical weights until results improve.

Using the model

Freeze the learned weights, provide a new input, and calculate an output.

© 2026 Axiovex Systems, LLC. All rights reserved. v1.0.16 · 2026-11-03

A large language model predicts the next piece of text

What you send in counts as input tokens; what the model writes back counts as output tokens. Most services charge per token, and output usually costs more.

Why it feels intelligent

At enormous scale, prediction captures language, concepts, patterns, and useful procedures.

Why fluency can mislead

Its basic job is a plausible continuation, not a built-in guarantee of truth or intent.

© 2026 Axiovex Systems, LLC. All rights reserved. v1.0.16 · 2026-11-03

The harness turns a model into an agent

Model

The brain: proposes what to do next.

Memory

Keeps useful facts and task state.

Tools

The hands: reads, writes, searches, or operates.

Loop

Observe, plan, act, check.

Guardrails

The leash: permissions, approvals, limits, and stops.

> The model suggests. The harness decides what it can see, do, remember, and when it must stop.

© 2026 Axiovex Systems, LLC. All rights reserved. v1.0.16 · 2026-11-03

The loop repeats four simple moves

Finish

The result meets the stated goal.

Ask a human

The evidence is weak, the case is unusual, or approval is required.

Fail safely

A guardrail stops the action before harm spreads.

© 2026 Axiovex Systems, LLC. All rights reserved. v1.0.16 · 2026-11-03

Agentic AI is a dial, not an on-off switch

Suggest
A human performs every action.

Prepare
The agent drafts; a human approves.

Execute within bounds
The agent acts under policy and limits.

Operate and escalate
The agent handles routine cases and stops on exceptions.

> Increase autonomy only as evidence, guardrails, and reversibility increase.

© 2026 Axiovex Systems, LLC. All rights reserved. v1.0.16 · 2026-11-03

Start where errors are reversible and evidence is available

Good first use

Frequent task, measurable result, trusted data, limited harm if it fails, clear human owner.

Bad first use

Irreversible decision, controlled-data ambiguity, safety-critical action, no audit trail, unclear accountability.

© 2026 Axiovex Systems, LLC. All rights reserved. v1.0.16 · 2026-11-03

Manufacturing value starts in bounded workflows

Good starting points

- Quality evidence triage
- Predictive maintenance support
- Engineering knowledge retrieval
- Supplier and schedule risk analysis
- Documentation and compliance preparation

> **Budget more time for organizing your data than for the AI itself. Pilots die on messy data.**

© 2026 Axiovex Systems, LLC. All rights reserved. v1.0.16 · 2026-11-03

There are three sensible ways to adopt AI

1

Approved software service

Cost and effort: lower setup, faster start.

Require enterprise data protections, access controls, and vendor review.

2

Private deployment on your own systems

Cost and effort: higher.

Offers more control for sensitive data, but needs internal skills, security, and maintenance.

3

Deliberate waiting

Cost and effort: low technology spend.

Build literacy, clean data, and policy now so waiting does not become falling behind.

CMMC makes the data boundary an executive decision

Decision rule

AI tooling that touches CUI must live in environments approved for that data under the contract — meeting the safeguarding and CMMC terms the contract requires.

1 Classify first

Know whether the data is CUI, export-controlled, proprietary, personal, or public.

2 Approve the environment

Match the tool, storage, model, access, and logs to contract requirements.

Pasting controlled technical data into a public chatbot can jeopardize contract eligibility.

CMMC means Cybersecurity Maturity Model Certification. Use current contract, cybersecurity, export-control, and records requirements. This class is not legal or compliance advice.

© 2026 Axiovex Systems, LLC. All rights reserved. v1.0.16 · 2026-11-03

Three boundaries to set first

No CUI or export-controlled data in public AI tools.

No agent connected to production, ERP, or payment systems without written approval.

No AI-drafted compliance or contract submissions released without human verification.

Hallucination is a system-design problem

Imagine a repair shop passing a difficult job between shifts. Each mechanic works from the customer's complaint, service history, and previous mechanics' notes. That's the context.

Suppose someone writes "fuel pump tested fine" even though that test never happened. That's like a hallucination: a plausible detail presented as fact.

As the notes grow, someone condenses them into a short handoff. "Possible electrical fault—still unconfirmed" becomes "electrical fault." That's how context compression can lose an important qualification.

The next mechanic now rules out the pump and chases an electrical problem. Each step may sound reasonable, but it rests on faulty information.

AI can go wrong in a similar way. Keep the original records, separate verified facts from guesses, and check critical details before the next decision depends on them.

Why it happens

- Plausibility is not truth
- Context may be missing or conflicting
- The model may guess instead of saying "I don't know"
- Confident wording does not mean the answer is right

How to contain it

- Ground answers in approved sources
- Require citations and repeatable checks
- Test on real failure cases
- Allow "I don't know"
- Keep humans on consequential decisions

Risk framing: NIST AI RMF 1.0 and Generative AI Profile, NIST AI 600-1.

AI makes old fraud faster and more convincing

Instructions can be attacked

Malicious text can try to override an agent’s instructions or make it leak data.

Executives can be impersonated

A cloned CEO voice authorizes a wire. A convincing fake supplier email changes payment details.

Connected tools raise the stakes

Broad permissions can turn one bad instruction into a real operational or financial action.

Control: verify every payment or credential change through a separate trusted channel.

Also use least privilege, approvals, isolation, logs, limits, and a kill switch. Security framing: OWASP Top 10 for LLM Applications 2025.

Watch this 2014 warning: we are the horses

1915 → 2014

CGP Grey, “Humans Need Not Apply”

Mechanical muscle reduced the economic role of horses. Mechanical minds can reduce demand for human cognitive labor. The analogy still bites because capability keeps getting cheaper, broader, and easier to deploy.

https://www.youtube.com/watch?v=CMFj75kBQlU

Scan to watch

> The lesson is not panic, and an analogy is not a prediction. It is a reason to adapt while we still have choices.

© 2026 Axiovex Systems, LLC. All rights reserved. v1.0.16 · 2026-11-03

Make adaptation practical for workers and small manufacturers

For employers

- Map tasks before eliminating roles
- Train domain experts to supervise AI
- Create mobility paths before disruption
- Measure safety, quality, autonomy, and who benefits

For public leaders

- Fund shared training, secure test environments, and cyber readiness
- Ask companies for data boundaries, human accountability, and a workforce plan
- Keep small manufacturers included through pooled expertise and practical pilots
- Build retraining through local workforce agencies and community colleges

Workforce framing: OECD Employment Outlook 2023.

At your table: name one workflow and one boundary

One workflow

Where could AI remove friction or improve a measurable result?

One boundary

What must the AI never see, decide, or do on its own?

The full design worksheet belongs in the take-home handout.

© 2026 Axiovex Systems, LLC. All rights reserved. v1.0.16 · 2026-11-03

Open Q&A

Manufacturing. Engineering. Defense. Policy. Security. Workforce.

What decision do you need to make next?

© 2026 Axiovex Systems, LLC. All rights reserved. v1.0.16 · 2026-11-03

One commitment per table: one workflow, one boundary

Workflow
Where will you explore value?

Boundary
What will you protect from the start?

> We must be proactive rather than reactive. Waiting raises the risk of avoidable job losses and economic damage.

Keep learning: AI is moving very fast. What applies today may not apply a year from now. Regular follow-up courses can keep this community current.
